## Scale-space operators

1. Consider a Gaussian kernel

$$G(x, y, \sigma) = \frac{1}{2\pi\sigma^2} e^{-\frac{x^2 + y^2}{2\sigma^2}}.$$
 (1)

The convolution of a Gaussian with itself is also a Gaussian, i.e.,

$$G(x, y, \sigma) * G(x, y, \tau) = G(x, y, \sqrt{\sigma^2 + \tau^2})$$

$$\tag{2}$$

Make an image,

$$I(x,y) = G(x,y,\sigma), \tag{3}$$

for some fixed  $\sigma$ , and confirm the above by calculating images from its scale-space,

$$I(x, y, \tau) = I(x, y) * G(x, y, \tau), \tag{4}$$

using Matlab and, e.g., using the scale function written previously.

2. Consider the 2-dimensional scale normalized derivatives at scale  $\tau$ ,

$$I_{x^{i}y^{j}}(x,y,\tau) = \tau^{\gamma(i+j)} \frac{\partial^{i+j} I(x,y,\tau)}{\partial x^{i} \partial y^{j}},$$
 (5)

where  $\gamma \in \mathbb{R}$  is a parameter of the scale normalization. Now consider the scale normalized image of the Laplacian,

$$H(x, y, \tau) = I_{xx}(x, y, \tau) + I_{yy}(x, y, \tau),$$
 (6)

Using  $\gamma = 1$ , solve the following:

- (a) Calculate the analytical expression for  $H(x, y, \tau)$ .
- (b) Consider the point (x, y) = (0, 0) and derive analytically the scale(s),  $\tau$ , for which  $H(0, 0, \tau)$  is extremal. Maple (or Mathematica) may be helpful. Characterize these extremal point(s) in terms of maximum, saddle, and minimum in  $(x, y, \tau)$ .
- (c) Confirm your result in Matlab.
- (d) The maxima in  $(x, y, \tau)$  of (6) is called blob detection. Detect the 20 largest maxima in the sunflower.tiff image, and indicate each detected scale  $\tau$  with a circle centered on the point of detection and with a radius of  $\tau$ .
- 3. Consider a soft edge,

$$J(x,y) = \int_{-\infty}^{x} G(x',y,\sigma) dx'$$
 (7)

for some constant  $\sigma$ . Consider also its scale-space,

$$J(x, y, \tau) = J(x, y) * G(x, y, \tau), \tag{8}$$

and the scale-normalized spatial squared gradient magnitude operator

$$\|\nabla J(x, y, \tau)\|^2 = J_x^2(x, y, \tau) + J_y^2(x, y, \tau). \tag{9}$$

Using  $\gamma = \frac{1}{2}$ , solve the following:

- (a) Write the closed form expression for  $\|\nabla J\|^2$ .
- (b) Derive analytically the scale,  $\tau$ , for which  $\|\nabla J\|^2$  is maximal in the point (x,y)=(0,0). Is this a maximum in  $(x,y,\tau)$ ?
- (c) Confirm your result in Matlab.
- (d) The maxima in  $(x, y, \tau)$  of (9) is edge detection with scale-selection. Detect the 100 largest maxima in the hand.tiff image, and indicate the point of detection and scale by circles.

## Inverse filtering

- 4. Write a program that takes an image, a kernel and a realisation of a noise source, and which returns the linear, shift invariantly (LSI) degraded result.
- 5. Implement inverse filtering together with a band-pass filter to avoid numerical instabilities, and apply it to a LSI degraded image of lena.tif. Discuss this approach's ability to recover the original image.
- 6. Repeat the above exercise for the Wiener filter.
- 7. Consider the Laplacian as the linear operator and implement constrained deconvolution without using deconverg. Evaluate the result on suitable test images.
